

JoliPro IPL Photofacial Laser Home Device

When pairing the JoliPro IPL Photofacial Laser Home Device with the Topical PRX-T Peel Serum, you unlock an advanced clinical dual-action approach. Traditional medical-grade TCA peels are heavily contraindicated immediately after light therapies due to heavy epidermal shedding and burn risks. However, the specialized at-home PRX-T formulation utilizes a mild, non-peeling biorevitalization mechanism. The gentle blend of Trichloroacetic Acid (TCA), Kojic, Citric, Tartaric, and Phytic acids bypasses aggressive skin peeling. Instead, it works beneath the surface. This safely lifts hyperpigmentation and accelerates collagen production right after an IPL light session.

1. Skin Preparation Protocol

Proper pre-care prevents adverse thermal skin reactions. It ensures the IPL light safely targets either the hair root or localized melanin pockets without surface interference.

Sun Restriction: Halt all UV exposure, tanning beds, and self-tanning lotions for 2 weeks before treatment to prevent blistering.

The Actives Pause: Discontinue prescription retinoids, over-the-counter retinols, glycolic acid, salicylic acid, and strong Vitamin C for 5 to 7 days before using the device.

Shaving Timeline: If using the device for laser hair removal, close-shave the skin 12 to 24 hours prior. Never wax, pluck, or use depilatory creams, as the hair root must remain fully intact for the IPL energy to track down the follicle.

Immediate Prep: Wash the target area using a basic, gentle cleanser to completely remove oils, makeup, and SPF. Dry the skin perfectly. Do not apply any lotions, gels, or numbing creams before firing.

2. Operating & Frequency Guide for the JoliPro IPL Device

The JoliPro handheld system utilizes intense pulsed light converted into thermal energy to break apart epidermal pigment (for a photofacial) and disable the root of the hair follicle (for hair removal).

The Patch Test: Always execute a single test flash on the lowest energy setting (Level 1) in your target area. Wait 24 hours to monitor for abnormal swelling, hyperpigmentation, or blistering.

Grid Pass Administration: Place the flash window perfectly flush against the skin at a 90-degree angle. Standard corrective treatment utilizes 1 to 3 clean passes over the area per session. Never flash the same spot repeatedly during a single session, as this builds dangerous heat traps in the tissue.

Usage Frequency:

Active Corrective Phase: Use the JoliPro device 1 to 2 times per week. Maintain this steady cadence for an initial cycle of 6 to 8 weeks to successfully stunt hair growth or shatter dark spots.

Maintenance Phase: Transition down to once every 4 weeks to maintain long-term smoothness and clarity.

3. Applying the Topical PRX-T Peel After Laser

Once your IPL passes are finished, the skin is physically primed to absorb the bio-revitalizing elements of the PRX-T serum to target skin laxity, fine lines, and stubborn sun spots.

Cooling Window: Wait 5 to 10 minutes after your last IPL flash to ensure the initial internal thermal sensation in the skin has naturally dissipated.

Serum Layering: Apply several drops of the Topical PRX-T Peel Serum directly onto the clean, laser-treated skin.

Firm Massage: Using gloved hands or clean fingertips, firmly massage the serum into the treated skin using upward, lifting motions until it is completely absorbed.

No-Rinse Protocol: Unlike aggressive medical acids, this specific home formulation is engineered to stay on the skin to drive continuous cellular renewal. Do not rinse or wash it away.

Seal & Protect: Layer your favorite peptide cream, La Marine Cream, AM Cream (Anti-aging/Anti-Melasma Calming) and over the PRX-T layer to lock in hydration.

Sunscreen Lock: If you complete this advanced routine during daytime hours, you must finish with a broad-spectrum physical SPF 30 or higher to shield your vulnerable skin barrier from post-treatment UV damage.
